Habitat Use and Movements of Two Ecotypes of Translocated Caribou in Idaho and British Columbia on JSTOR

Species Summary: Rangifer tarandus pop. The dispersed nature of the population, the use of shore-lines useful for escape, and the avoidance of islands travelled by wolves, Canis lupus, suggest that the migration of this herd was a spacing tactic to reduce predation risk. Musk ox from Alaska, Canada, and Greenland are all eligible for entry into the single category recognized today.

Scale

Caribou could one day be transplanted back to southern British Columbia, the reports—but only if conservation efforts succeeded in reversing the fate of flailing herds. The Partnership Agreement has considerable potential to help recover caribou because it includes temporary moratoria on new logging and road development across more than 5,000 square kilometres of caribou habitat, and will also add approximately 2,000 square kilometres to the existing Klin-se-za Provincial Park. In these RRAs, no new gas tenures will be sold for a 5-year review period.

Caribou

Radio telemetry data and recruitment surveys will help refine the initial indication that this herd could contribute caribou to a captive breeding program. Long description This is a map of the current distribution of sub-populations and local populations of mountain caribou in Canada.

Comprehensive Reports

Threats Barren-ground caribou Climate change and changing weather patterns can greatly affect barren-ground caribou, for example by changing food availability, as well as increasing the rates of predation, parasites and diseases. In partnership with the Government of Canada, the Province and BC Hydro are reducing rates and lowering the costs of connecting to the electricity grid to help industries, public transportation agencies and neighbourhood energy systems reduce greenhouse gas emissions and attract new clean tech industries to British Columbia. The line follows I-5 south to the area of Anderson, where the Sacramento River moves east of I-5, following the Sacramento River until it joins with the San Joaquin River, which is followed to the south border of Stanislaus County.

The Last Wild Caribou of the Lower 48 Has Been Placed in Captivity

The currently available evidence does not support the characterization of climate change as a primary driver of southern mountain caribou declines. In our opinion, the provincial plan is not good enough.

Comprehensive Reports

The prophecy says that we will find sanctuary at the Twin Sisters Mountain. This was not consistent with the approach taken for boreal caribou.
