Society

Along with the notable increase in GDP in the same year, this can be attributed to the globalisation activities of a small number of companies.

Society

The lowest ratio of GNI to GNP was in Luxembourg at 65. The proportion of the population aged 45 to 64 also increased, rising from 21. This is a decrease from 99.

Economy

Female life expectancy at birth in 2012 was 83. Therefore measurement tools can be very useful to get an idea of the bigger picture.

Measuring Ireland's Progress: Life expectancy gains

The EU average in 2016 was 29. This was the fourteenth lowest unemployment rate in the EU28 in 2018.

Measuring Ireland's Progress: Life expectancy gains

Furthermore, eight countries in the EU28 had a GDP growth rate less than 2% in 2018: Greece, France, Finland, Denmark, Germany, Belgium, the United Kingdom and Italy.

Measuring progress

Emigration to the United States of America also decreased over this time period, from 14,100 in 2013 to 4,500 in 2018. It is a travesty that so many can stare financial hardship at such close quarters, while the Government indulges those on the other extreme of the wealth stakes by facilitating their paying little, or not a whit, for the public services provided by the State.
