There are accessor functions that fetch feature values from the current context data pipeline in the case of an offline model or current request from client in the case of an online model or from the Feature Store. The result immediately solidified his reputation as a sculptor of skill and technical perfection.

In the case of decision tree models, we let the user browse through each of the individual trees to see their relative importance to the overall model, their split points, the importance of each feature to a particular tree, and the distribution of data at each split, among other variables. In western world, he was the first - the last - to regard himself as an absolute and mythic cultural experience.
