Government Regulations: Do They Help Businesses?

For all other construction activities a SWMS is not required. Regulators are the main audience for this guidance. However, in many situations, special systems must be developed to meet the specified requirements.

Construction

This Code also includes various references to provisions of the WHS Act and Regulations which set out the legal requirements. This approach is usually applied at the beginning of the construction phase of the project life cycle.

Project Management for Construction: The Design and Construction Process

Work carried out under an approved method is permitted as asbestos-related work, even though it will not be specifically mentioned in the Asbestos Regulations.

Waste Disposal Management Plan (Environmental)

Finally, the availability of components at the required time during the construction process should also be considered. It highlights a range of suitable and smart ways of working for authorities, based on good practice identified across Member States. Its primary purpose is to help supervisors and workers implement and monitor the control measures established at the workplace to ensure high risk construction work is carried out safely.

Waste management

This amount is equal to approximately 12% of total emissions in 2010. The condition of the concrete and tendons should be considered before and during demolition, for example by:

- conducting a visual inspection to confirm loads, obvious deviations from the original design and waterproofing details
- assessing conditions throughout the building, as well as utilising selective testing in representative areas to assess any weakening or breakage of tendons
- measuring humidity within tendon sheathing and analysing any sheathing contaminants
- removing, inspecting and testing a small number of tendons to assess their condition, and
- continuing to monitor tendon tension.

So far as is reasonably practicable, the duty holders involved must consult each other on the hazards and risks associated with the building and work together on appropriate design solutions.

Management and removal of asbestos

Across the 306 species studied, the average rate of decline was much lower after protection than before. A written safety report is not required for designs of structures that have typical features such as a single storey, timber framed, slab-on-ground house constructed in a new housing estate using typical housing materials designed to be built by housing industry tradespeople and workers. Workplace PCBU's can manage naturally occurring asbestos on an ongoing basis with an air monitoring program.

Emergency Preparedness: Planning and Mitigation

They should not be shared for hygiene reasons.
