## **Bovine Tuberculosis: Causes, Transmission, Signs, Treatment, and Control**

If the bcg vaccine is used then it is impossible to differentiate between cattle that have TB and cattle that have been vaccinated.

## **Bovine Tuberculosis: Causes, Transmission, Signs, Treatment, and Control**

However, surveillance in wildlife is often conducted in other areas of the United States following the detection of bovine TB in domestic livestock or captive cervids. However, in Michigan only 64% of deer exhibited lesions and only 42% would have been recognizable to hunters. But rural African farmers aren't the only ones at risk: in 2004, dozens of New Yorkers were infected with tuberculosis, and one infant died, after consuming contaminated unpasteurised cheese.

## **USDA APHIS**

Tuberculosis TB is a serious bacterial disease caused by Mycobacterium, a group of bacteria that usually affects the respiratory system. If you own land in the Bovine Tb Management Zone Picture 1 you should contact Joe Caudell 812 334-1137, the Indiana State Deer Biologist, or the Indiana Bovine Tb Hotline at 844 803-0002.

## **Fact Sheets**

Intradermal tuberculin 4 ml is injected subcutaneously into the neck of cattle with a rectal temperature of not more than 102 degrees F 39 degrees C at the time of injection. If an infected animal is detected, an investigation is initiated by the California Department of Food and Agriculture to determine the origin location of the animal. For example, disease in the lungs can be associated with a cough, and gastrointestinal disease can cause abdominal pain and diarrhea.

## **Bovine TB a hidden killer**

The standard and effective control measures of TB in cattle are as follows: 1. Under the right environmental conditions, the bacteria can remain

viable in the environment for months. Bovine tuberculosis does not threaten the quality and safety of milk and meat products produced in California.
