### Adolescents and Young Adults with Chronic or End

To explore the concept of the young adult chronic patient as a distinct clinical entity, the author analyzed a sample of 134 chronic patients on six variables relating to style of interaction with service providers and on diagnostic and demographic variables. PMID: 17367524 Free PMC article.

### Adolescents and Young Adults with Chronic or End

In the setting of puberty and learning to become self-sufficient, adolescence is a critical time for growth and psychosocial development. Background: Adolescents and young adults face unique and complex physical, psychological, and family challenges. Most deny their mental illness and make inappropriate use of mental health services available to them.

### Young adult chronic patients: an analytical review of the literature

The results showed that the 105 younger chronic patients in the sample were more likely than the older patients to be male, to be referred to treatment for suicidal and homicidal gestures and ideation, to have a diagnosis of personality disorder, and to be overrepresented in the treatment population.

### Substance abuse by young adult chronic patients

Adolescents have different CKD etiologies and progress along a course dissimilar to the adult population, but have similar multifarious comorbidities. Young adult chronic patients are best helped via flexible, accessible, nonstigmatizing, team-oriented treatment programs. The author discusses the clinical diversity and program requirements of these patients.
