This structure, which functions like a glue, is known as the corpus callosum. Facial hemiplegia People with facial hemiplegia experience muscles on one side of their face.

Upper Extremity Rehabilitation Training Using Brain

Results: There was no significant difference in Barthel index and FMA score between the treatment group and the control group before treatment. View passive range of motion exercises you can do yourself at or view exercises the caregiver can do for the patient at under the passive range of motion section. The difference between the two is that the former uses X-rays, while the latter uses a magnetic field and no radioactivity is involved.

Rehabilitation of Gait in Patients With Hemiplegia: A Comparison Between Conventional Therapy and Multichannel Functional Electrical Stimulation Therapy

Severe physical stroke symptoms affecting one side of the body may fall under the category of hemiparesis or hemiplegia. They also have resources for people based in Canada or the United Kingdom. The first reason is that the real problem which brought the hemiparesis to the hemiplegic patient, was the cerebral injury and the relative alteration of the cognitive processes which allow the movement.

Effects of rehabilitation training of core muscle stability on stroke patients with hemiplegia

The superiority of the MFES method as compared with conventional therapy was mainly attributed to the enhanced motor learning accomplished by application of MFES.

Upper Extremity Rehabilitation Training Using Brain

For example, a left hemisphere stroke can result in , because each half of the brain controls the opposite side of the body. Hemorrhage can also occur in newborns. During , the patient performs exercises with the unaffected limb, but because of the reflective surfaces inside the box and the angle at which those surfaces are positioned, it appears to the patient as though the affected limb is being exercised.
