### Identifying opportunities to support patient

Results showed that most participants used a range of coping strategies; however, there were interactions between stressor domains existential, psychosocial, physical and coping categories problem focused, emotion focused, emotion avoidant.

### War on Cancer Asia 2019

Mental health professionals conduct the assessment interview to determine how well a patient is adjusting. Long-term survivorship The adjustment from posttreatment to long-term survivorship is gradual and extends over many years. What are the emotional and social effects on the person living with cancer, their family and friends? With large sample sizes, more detailed models can be fit that account for all of the predictable variation based on known covariates, but even then a component of variation because of random error, which is unpredictable, will remain.

### User

Recent trends in breast cancer among younger women in the United States. Dr Tan also established the international diagnostic criteria and lifetime cancer risks for Cowden syndrome, a hereditary breast cancer syndrome, and led a breast cancer screening research study involving over 29,000 individuals followed up over 20 years.

### Adjustment to Cancer: Anxiety and Distress (PDQ®)

In the synchronous mode, participants are online simultaneously at a prearranged time, and immediately react to each other's responses as these are received.

### Surveillance of Demographic Characteristics and Health Behaviors Among Adult Cancer Survivors — Behavioral Risk Factor

## **Surveillance System, United States, 2009**

In: Holland JC, Breitbart WS, Jacobsen PB, et al. National Cancer Institute Office of Cancer Survivorship fact sheet. Prof Psychol 31 2 : 206-15, 2000.

### **Online focus groups as a tool to collect data in hard**

Patients in this group were instructed to first view the videotape and then review the booklet, following its instructions for further training, practice, and use of the various techniques. The most important is predictive power, which can be measured on the spread of risk produced in the population, either in terms of the proportion exceeding a specified risk threshold or by more general but less easily comprehended measures such as the concordance index or area under a receiver operating characteristic curve AUC.

### **Adjustment to Cancer: Anxiety and Distress (PDQ®)**

Second, patients with lower compared with higher educational attainment were found to be at higher risk for resignation. For example, participants had an immediate negative reaction to the prominence of the log-in area on the home page.
