### Toxic hepatitis

It is therefore important to diagnose this disorder early, in the pre-cirrhotic stage. Other important findings that indicate poor survival are a peak prothrombin time greater than 40 seconds, elevated serum creatinine, and low arterial pH.

### What is Drug

Take prescription and nonprescription drugs only when absolutely necessary. Progression to cirrhosis is believed to be more common with HBV-HDV chronic infections than with HBV infection alone.

### Diffuse Liver Disease

**Radiologic Findings** Ultrasound On sonographic evaluation, the liver is enlarged with increased echogenicity and beam attenuation, presumably from fatty infiltration and possibly contributed to by the excess glycogen deposition. These include mononucleosis; herpes simplex; cytomegalovirus infection in patients with acquired immunodeficiency syndrome

AIDS ; yellow fever in tropical countries;  
and rubella, adenovirus infection, and  
enterovirus infection in children.  
Hemosiderin is found in both acinar and  
islet cells, and some correlation is reported  
between the degree of iron deposition in  
pancreatic islets and the severity of  
endocrine dysfunction.

### **Prevention and treatment of drug**

This probably relates to variant arterial  
supply or venous drainage as described  
before. It may reflect allergy to the drug or  
a metabolic aberration of the host  
permitting the production of hepatotoxic  
metabolites. It is acetylated to  
acetylisoniazid, which, in turn, is  
hydrolyzed to acetylhydrazine.
