Associations of Personal and Family Preeclampsia History With the Risk of Early

Another methodological issue is that numerous statistical tests were carried out and accordingly the probability of chance findings was increased. All information on personal risk behaviours was self-reported, and therefore social desirability bias and measurement error may have influenced our results. Interestingly, the two groups that did not have significantly greater risk of developing CRC compared to the low risk group tended to engage in high levels of physical activity, which could be evidence of the importance of physical activity for offsetting some other unhealthy behaviours.

Parental Alcohol History Differentially Predicts Offspring Disorders in Distinct Subgroups in Israel

Because of the longitudinal nature of the data, many variables were constructed using multiple waves of data from the NLSY79.

Diagnosis and Management of Osteoporosis

Maternal family history of preeclampsia A maternal family history of early-, intermediate-, or late-onset preeclampsia was associated with 2.

Behavioral Economics, Disclosure Gaps, and Customer Journeys in Life and Health Insurance

You are using a browser version with limited support for CSS. It is associated with an increased risk of venous thromboembolism and a decreased risk of invasive breast cancer.
