The following areas were addressed: the realities of oil and gas supply, prediction of oil and gas production, problems in oil and gas modeling, resource appraisal procedures, forecasting field size and production, investment and production strategies, estimating cost and production schedules for undiscovered fields, production regulations, resource data, sensitivity analysis of forecasts, econometric analysis of resource depletion, oil and gas finding rates, and various models of oil and gas supply. The harvesting, preprocessing, and logistics HPL of biomass commodity supply chains thus could introduce spatially variable environmental impacts into the biofuel life cycle more » due to needing to harvest, move, and preprocess biomass from multiple distances that have variable spatial density.
