Noncontact Atomic Force Microscopy of Perfect Single Crystals of Pentacene Prepared By Crystallization from Solution. Recent Progress in Organic Electronics: Materials, Devices, and Processes.

Physical Review B

The papers of the first group address the properties of interfacial and confined water upon supercooling in an effort to understand the relation with anomalous behavior of supercooled bulk water. In the long-wavelength limit, it is found that the sliding mode shows a remarkably small energy gap, indicating very weak interactions between the two incommensurate sublattices.

Computational and experimental approaches for investigating nanoparticle

Lab-in-a-tube allows to get deeper insight into the influence of materials and confinement on the bone formation at the single cell level.

[1812.02685v1] From isomorphism to polymorphism: connecting interzeolite transformations to structural and graph similarity

The authors discuss recent progress in understanding the anomalies of water in bulk, nanoconfined, and biological environments. Theorists invoke these ideas in hopes of solving particular problems with existing theories. Other samples represent various samples of DNA.
