Typically the higher the average level of education in an economy, the higher the accumulated human capital and the higher the labor productivity. Such surveys can be designed to cover virtually the entire non-institutional population of a given country, all branches of economic activity, all sectors of the economy and all categories of workers, including the self-employed, contributing family workers, casual workers and multiple jobholders. This steady increase begs the question: what drives productivity growth? An aggregate production function specifies how certain inputs in the economy, like human capital, physical capital, and technology, lead to the output measured as GDP per capita.

Here's how it impacts your workplace—and our democracy. Latest data three months to April 2017 record female participation all those over 16 in the labour force at 58. They note, for example, that the decline in the labour share in Canada since 1994 has not been due to any increase in profit share, but to an increase in the share of depreciation or capital consumption allowances associated with the short services lives of high-tech investment goods.
