11.2.6 Conjugate Addition to α, β

In this case 1,4-addition dominates because the stable carbonyl group is retained. THEME 5 REACTIVITY OF SUBSTITUTED BENZENE DERIVATIVES Activation and deactivation of the benzene ring.

Something else is happening, something which prevents the nucleophilic bromide ion from attacking the face of the carbocation which already is attached to the first bromine. Inductive effect and resonant effect of substituents. In them, the student acquires the skills of a chemistry laboratory and consolidates the knowledge acquired in the theory classes.

The teacher may be supported by audio-visual and computer media but, in general, students will not handle them in class.

1.27: Electrophilic Additions

After an explanation by the teacher, the student will individually or in groups of two carry out the experiments and calculations necessary to achieve the objectives of the practice, collecting in the laboratory journal the development of the practice and the calculations and results that come , Presenting the same day or the next session the results, which will be evaluated. In the functional group of an alkene - the carbon-carbon double bond -- the most readily available electrons are those in the pi bond. Good condition with some wear on covers and markings inside. Hydrogenation is important in the conversion of highly unsaturated many double bonds fats to fats with fewer double bonds. Main methods of preparation of alkynes.

CE7 - To know properties of the organic, inorganic compounds and metallic organ. We then expect to see the product in which the attacking H + is attached to the less substituted carbon and the OH is attached to the more substituted carbon. This means the competition between 1,2 and 1,4 addition is under thermodynamic control.
