Report on International Practical Temperature Scale of 1968

Two other disinfection agents are worthy of mention: ozone, which is widely used in Europe and in approximately 20 treatment plants in Quebec; and chlorine dioxide, which is primarily employed in Canada for taste and odour control. Organics in Ontario drinking water.

ShieldSquare

At temperatures above 15 °C, the growth of nuisance organisms in the distribution system becomes a problem and could lead to the development of unpleasant tastes and odours. Buffering action due to the

Filesize: 14.510 MB

presence of carbonates and other weakly acidic species found in potable water will modify this effect. At a given pH, higher temperature leads to greater dissociation of hypochlorous acid.

The International Practical Temperature Scale of 1968 in the Region 90.188 K to 903.89 K as Maintained at the National Bureau of Standards

Chlorination of organics in drinking water. The temperature used for the standard odour test in water is 40 °C. Creating a scale of measurement

has been a challenge, too.

ShieldSquare

It is, therefore, difficult to make generalized statements concerning the effect of temperature on corrosion in water treatment systems.

ShieldSquare

However, this was strongly influenced by air pressure and was little more than a novelty. National Bureau of Standards Platinum Resistance Thermometry Laboratory.
