## Inpatient Sleep Aid Utilization

For a period of 4 consecutive months, all hospitalized patients on IV PPI, aged 18 and above, were identified. In the manage phase, which interacts with all the phases of risk assessment, a team is assembled, historical data are reviewed, techniques to be used in risk assessment are identified, and all activities related to these should be managed.

## Peptic ulcer disease in a patient with ankylosing spondylitis receiving a conventional nonsteroidal anti

Study concept and design: Drs.

## Peptic ulcer disease in a patient with ankylosing spondylitis receiving a conventional nonsteroidal anti

Antibiotics are misused when they are prescribed unnecessarily i.

## List of Stomach Ulcer (Gastric Ulcer) Medications (43 Compared)

A total of 180 70% participants correctly answered that ceftriaxone is the most effective drug crossing the blood-brain barrier where as 62 24% and 10 4% of participants incorrectly chose vancomycin and clindamycin above ceftriaxone. How is our use of antibiotics contributing to the problem 10. In line with the need to diffuse data on AMR rates among key-pathogens, it is clear from the present results that the hospital pharmacy should diffuse timely and accessible information about the availability of AMs.
