## Solivik Island, Utukok Pass

All lodes now known are along the northwest front of the Alaska Range from Muldrow Glacier southwest to the basin of the Tonzona River. The character of the deposit is inferred from properties noted in the sulfur-rich rock fragments found in glacial moraine.

## Solivik Island, Utukok Pass

In addition to the large, low-grade deposits are a few, much smaller, higher-grade deposits. At least three types of these materials are known to be present: 1 deposits of clay in early glacial lakes, 2 claystone interbedded with other sediments in the Tertiary coal basins in the Railroad belt and elsewhere, and 3 clay developed by hydrothermal alteration.
