Monteggia fracture PT management : Physiosunit

Acta Chir Orthop Traumatol Cech. As described in our case, the missed diagnosis during the initial presentation, the malunion of the ulna, and the heterotopic ossification of the elbow as the contributing factors to persistent dislocation of the radial head is strongly suggestive. The preferred treatment strategy has no significant effect on the results as long as it provides radial head reduction.

Methods: Ten patients with a Monteggia-like lesion were included in this study and clinical and radiological follow-up examinations at an average of 12.

EPIDEMIOLOGY AND TREATMENT OF MONTEGGIA LESION IN ADULTS: SERIES OF 44 CASES

Anatomic reduction of the ulna is usually required before radial head reduction. In this theory, the elbow is in hyperextension at impact, and a reflex contraction of the biceps dislocates the radial head anteriorly. In the remaining patients, chronic compressive changes and epineurial fibrosis of radial nerve were observed, related to the time between injury and operation.

An accompanying wrist injury should not be overlooked. Stand firmly and grip the dumbbell with the affected hand. Radiography demonstrated dislocation of the radial head with a concomitant fracture of the third proximal ulna upon initial presentation at the local hospital Fig.

Monteggia and Monteggia
